The perfect solution for when extra weight is needed

Improved stability in adverse weather conditions

The Step Block Anti-lift Strut is a one piece pre-galvanised construction. The design allows for the placement of a step block, which provides extra stability and weight, especially in extreme weather conditions. This stabiliser system ensures a tighter fence line and a professional appearance while making it very difficult to open the fencing line. In addition, the anti-lift strut is compatible with our range of temporary fences.

- Easy to install
- Increased wind resistance
- Suitable for all Heras fence panels

Quick and easy to install

These stabilisers are quick and easy to install when erecting a temporary fencing line. The strut is connected between two panels and only needs one coupler to keep it in place when used with the step block. The base is then placed under the step block, holding the stabilising bar in place.
